Wrap Up

### What We're Building

Please complete the following form **9 0** Field One: \* This is a placeholder Field Two: This text is going to be This text is going to be sanitized, so <u>javascript</u> can't be injected, <b>sanitized</b>, so <a href="javascript:alert('hello')">j • but some HTML avascript</a> can't be injected, but some HTML still works still works Field Three: Field Four: Field Five: 333 Field Six: three ▼ Cancel Save

Thanks for your Time!

#### Field Metadata

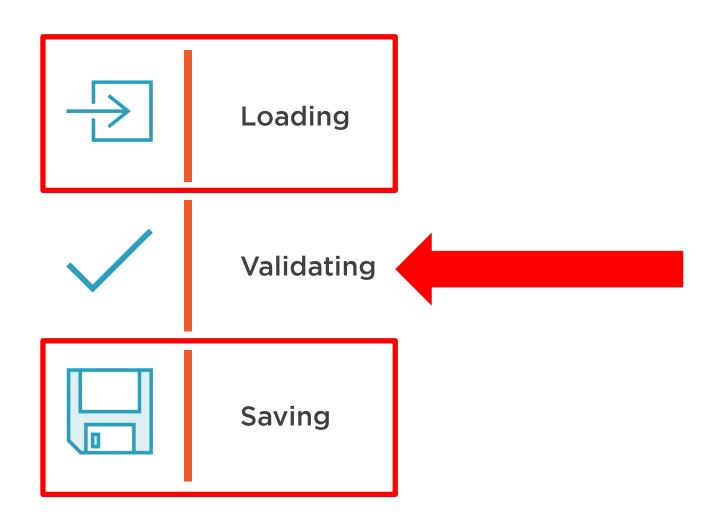

```
export abstract class FieldBase {
abstract displayAs: FieldControlType;
readonly internalName: string;
defaultValue: string | number | boolean;
displayName: string;
required = false;
placeholder = '';
checkUniqueFunc: (val: string) => boolean;
hint: (evt: HintEvent) => void;
focus: (field: FieldBase, ctrl: AbstractControl, e
blur: (field: FieldBase, ctrl: AbstractControl, ev
```

### Generating Field UI

- Iterate fields Collection
- Load template
- Set properties

### Data Operations

### **Angular Validation**

- Out-of-the-box
- Custom

### **General Types**

- Exists
- Range
- Equality
- Membership
- Pattern
- Custom

#### **Angular Validation**

- Out-of-the-box
- Custom

#### **General Types**

- Exists required
- Range
- Equality requiredTrue, pattern
- Membership
- Pattern 🗸
- Custom /

pattern, email

min, max, minLength, maxLength

### Key Takeaways

Metadata to define fields

Loading a component per field

HTMLElement properties from metadata

**Loading & Setting data** 

**Validation**
